## JOURNAL OF TRANSPORT

SCIENTIFIC-TECHNICAL AND SCIENTIFIC INNOVATION JOURNAL

VOLUME 1, ISSUE 4 DECEMBER, 2024

EDITOR-IN-CHIEF

**SAID S. SHAUMAROV**

*Professor, Doctor of Sciences in Technics, Tashkent State Transport University*

Deputy Chief Editor

**Miraziz M. Talipov**

*Doctor of Philosophy in Technical Sciences, Tashkent State Transport University*

---

Founder of the scientific and technical journal “Journal of Transport” – Tashkent State Transport University, 100167, Republic of Uzbekistan, Tashkent, Temiryo‘lchilar str., 1, office: 465, e-mail: publication@tstu.uz.

The “Journal of Transport” publishes the most significant results of scientific and applied research carried out in universities of transport profile, as well as other higher educational institutions, research institutes, and centers of the Republic of Uzbekistan and foreign countries.

The journal is published 4 times a year and contains publications in the following main areas:

- Business and Management;
  - Economics of Transport;
  - Organization of the Transportation Process and Transport Logistics;
  - Rolling Stock and Train Traction;
  - Infrastructure;
  - Research, Design, and Construction of Railways, Highways, and Airfields; Technology and Organization of Construction, Management Problems;
  - Water Supply, Sewerage, Construction Systems for Water Protection;
  - Technosphere Safety;
  - Power Supply, Electric Rolling Stock, Automation and Telemechanics, Radio Engineering and Communications, Electrical Engineering;
  - Materials Science and Technology of New Materials;
  - Technological Machines and Equipment;
  - Geodesy and Geoinformatics;
  - Car Service;
  - Information Technology and Information Security;
  - Air Traffic Control;
  - Aircraft Maintenance;
  - Traffic Organization;
  - Operation of Railways and Roads;
- 

Tashkent State Transport University had the opportunity to publish the scientific-technical and scientific innovation publication “Journal of Transport” based on the Certificate No. 1150 of the Information and Mass Communications Agency under the Administration of the President of the Republic of Uzbekistan. Articles in the journal are published in Uzbek, Russian and English languages.

## Research of the asynchronous generator used in micro HPPs via the MATLAB Simulink model

**U.T. Berdiyev<sup>1</sup>, M.M. Matqosimov<sup>2</sup>**

<sup>1</sup>Tashkent state transport university, Tashkent, Uzbekistan

<sup>2</sup>Andijan Machine-building Institute, Andijan, Uzbekistan

**Abstract:**

Using the imitation model of asynchronous generators used in microgames, it allows you to conduct analysis of various dynamic operating modes of renewable and asynchronous generators used in mini and microgames, as well as to obtain results and control control.

**Keywords:**

micro HPP, asynchronous generator, dynamic operating modes, matlab simulation, voltage, current

## **MikroGESlarda qo'llaniluvchi asinxron generatorini MATLAB Simulink modeli orqali tadqiq qilish**

**Berdiyev U.T.<sup>1</sup>, Matqosimov M.M.<sup>2</sup>**

<sup>1</sup>Toshkent davlat transport universiteti, Toshkent, O'zbekiston

<sup>2</sup>Andijon mashinasozlik instituti, Andijon, O'zbekiston

**Annotatsiya:**

MikroGESlarda qo'llaniluvchi asinxron generatorlarning imitatsiyaning modelidan yordamida qayta tiklanuvchi hamda mini va mikroGESlarda qo'llaniluvchi asinxron generatorlarning turli dinamik ish rejimlari tahlilini olib boorish hamda natijalar olish va boshqaruv nazorat olib borish imkonini beradi.

**Kalit so'zlar:**

mikroGES, asinxron generator, dinamik ish rejimlar, matlab simulik, kuchlanish, tok

### **1. Kirish**

Jahonda energiyaga bo'lgan extiyoji kun sayin ortib borishi natijasida har qanday energiyaning ishlab chiqarilishi arzon va sifatlari bo'lishini talab etadi. Elektr energiyasi kashf qilinganidan boshlab hozirgi kungacha elektr energiyaga bo'lgan talab tobora ortib bormoqda. Shu bilan birga elektr energiyasini ishlab chiqarilish dolzarbliги ortib bormoqda. Shu nuqtaiy nazardan qaraydgon bo'lsak olib borilayotgan ilmiy tadqiqot ishimizda elektr energiyaning ishlab chiqarilishi juda soda va oson bo'lgani uchun elektr energiyaning tannarxi kamayishiga olib kelmoqda. Bu esa Respublikamizda mikroGESlarning soni ortib borishiga turtki bo'ladi. MikroGES lar qurilishida suv omborlarining ekologik zararlarining oldini olish, stansiyalar qurilishida kichik kapital sarflar xarajatlar bo'lishi va kapital xarajatlarni qoplash imkoniyatlari dolzarb xisoblanadi.[1]

So'ngi o'n yillikda mikroGESlar dunyoda keng tarqalmoqda bunga asosiy sabablardan yana bira tabiiy energiya resurslarini kamayib tugab borayotganligi umumiy ta'siri sezilarli bo'lib, katta miqdorda elektr enegiyasi, shu bilan birga tabiiy gaz singari birlamchi energiya resurslar sarfini ham kamaytirish dolzarb muamolardan bo'lib qolmoqda. Shu sababli, mikroGESlarda qo'llanilayotgan asinxron generatorlardan foydalanish hamda elektr energiya ishlab chiqarish bo'yicha qator ilmiy izlanishlar olib borilmoqda.[3].

### **2. Tadqiqot metodikasi**

Differentsial tenglamalar tizimlari yordamida tavsiflashning klassik usuli eng umumlashtirilgan usul bo'lib hisoblanadi. Obyektning matematik modeli uning idealizatsiyasi hisoblanadi, shuning uchun tenglamalarni tuzishda va vaqtinchalik jarayonlarni ko'rib chiqishda "idealizatsiya qilingan" obyekt bilan bog'liq umumiy qabul qilingan cheklolvar va taxminlar qo'llaniladi.[3]

Shunday qilib, elektr mashinalari uchun tenglamalarni tuzishda, fazali chulg'amlar nosimmetrik, po'latdagagi yo'qotishlarni e'tiborsiz qoldiradi va hokazo. Obyektni soddalashtirish bilan bog'liq holda, matematik modelni haqiqiy obyektga sozlash muammosi paydo bo'ladi, uning mohiyati eksperimental ma'lumotlarga iloji boricha yaqinroq natija beradigan parametrlerning bunday qiyamatlarini aniqlashdir. Lozim bo'lsa, ko'proq omillarni hisobga olish mumkin, ammo bu differentsial tenglamalar tizimini yechishni ancha murakkablashtiradi va yechimning vaqtini oshiradi. Shu munosabat bilan qidiruv ixtisoslashtirilgan dasturlarga o'tkaziladi.[5]

Generator ishlayotganda quyidagi rejimlar mavjud bo'ladi: salt ishlashda kondensator qo'zg'alishi, isha tushish va yuklama ishlash, yuklama ostida qo'zg'alish. Ushbu rejimlarni asinxron mashinaning tenglamalar tizimi tufayli tahsil qilish mumkin.

Tenglamalar shaklini olishning eng keng tarqalgan usuli bu Kirxgoff, Amper qonunlarini elektr zanjirlariga qo'llash

a <https://orcid.org/0000-0003-3513-049X>

b <https://orcid.org/0009-0004-7849-8918>

va olingen tenglamalarni ma'lum koordinatalar tizimiga aylantirishdir.

Valdagi muvozanat qonunini yozish uchun mashinaning inersiyasini, rotoring burchak tezligini, rotorga ta'sir qiluvchi momentni hisobga oluvchi Nyutonning ikkinchi qonunidan foydalilanadi. Natijada, differential tenglamalar tizimi o'rganilayotgan tizimning barcha konturlarini kompleks tahlil qilishga imkon beradi. Biroq, olingen differential tenglamalar tizimini faqatgina hisoblash texnikasi yordamida yechish mumkin. Ko'p sonli konturli obyektning xarakteristikalarini qurish hisoblash texnikasiga bo'lgan talabni oshiradi. Bundan tashqari, asinxron generotor loyihasining yuqori aniqligi uchun elektr mashinasining to'liq magnit xarakteristikasiga ega bo'lish kerak, xarakteristikani to'g'ri chiziq bilan qabul qilish mumkin emas. Magnitlanish toki koordinatalarda haqiqiy egri chiziqli xarakteristikaga ega bo'lish talab qilinadi.

Asinxron mashina odatda stator va rotorda joylashgan magnit bilan bog'langan chulg'amlar tizimi sifatida tushiniladi. Statorning A fazasi chulg'ami va rotoring a fazasi chulg'aming o'zaro ta'sirini ko'rib chiqsak, shuni ta'kidlash kerakki, rotor aylanayotganda bu chulg'aming fazodagi o'zaro pozitsiyasi doimiy ravishda o'zgarib turadi. Qabul qilingan taxminlarni hisobga olgan holda o'zaro A va a chulg'amlari o'tasidagi induktivlik

$$M_{Aa} = M \cos \gamma \quad (1)$$

bu yerda  $M$  - A va a chulg'am o'qlari mos kelganda sodir bo'ladigan o'zaro induksiyaning maksimal qiymati;  $\gamma = \int_0^t \omega_r dt + \gamma_0$  - A va a chulg'amlari fazalarining o'qlari orasidagi burchak ( $\omega_r = 2\pi n$  rotoring burchak chastotasi;  $n$  - rotoring aylanish chastotasi,  $p$  - qutb juftlari soni;  $\gamma_0$  - rotoring boshlang'ich holatini aniqlaydigan burchak).

Magnitlanish toki koordinatalarda haqiqiy egri chiziqli xarakteristikaga ega bo'lish talab qilinadi.

Tenglamalar tizimi davriy va kompleks koeffisientlardan iborat bo'lmay, yechimlar kvazigarmomik va garmonik funksiyalar bilan tavsiflanadi [2, 3]. AG

sig'imli qo'zg'alishi d-q koordinatalar sistemasidagi kompleks shakldagi tenglama bilan tavsiflanadi:

$$\begin{cases} p + i\Omega)^2 x_m i_0 + (p + i\Omega)^2 x_{1\sigma} \bar{i}_1 + (p + i\Omega) r_1 i_1 + x_c i_0 = 0 \\ -x_c i_0 + (p + i\Omega)^2 x_{Ln} i_n + (p + i\Omega) r_n i_n + x_{Cn} i_n = 0 \\ px_{2\sigma} i_2 + r_2 i_2 + px_m i_0 = 0 \\ i_1 + i_1 = i_0 \\ i_n + i_C = i_1 \end{cases} \quad (2)$$

bu yerda  $p$  - farqlash operatori;

bu yerda  $p$  - farqlash operatori;

$i_1, i_2, i_n, i_C, i_0$  - mos ravishda stator, rotor, generator yuklamai, qo'zg'alish sig'imi, magnitlanish toklari;

$r_1, r_2$  - stator va rotor fazalarining aktiv qarshiligi;

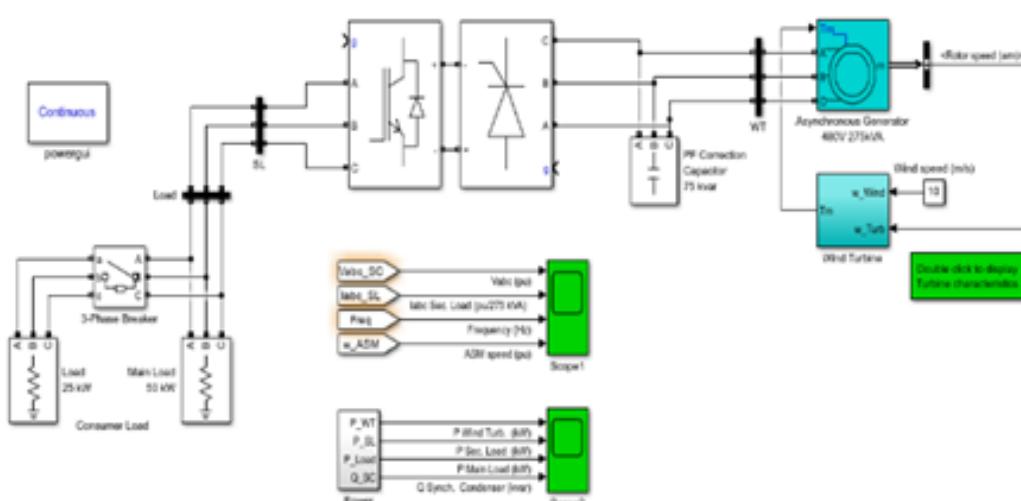

$x_{1s}, x_{2s}$  - stator va rotor fazalarining oqish induktiv reaktivligi;

$x_m$  - o'zaro induktiv qarshiligi;

$x_C, x_{Ln}, x_{Cn}$  - reaktiv qarshililiklar.

Ammo yozishning ushbu shaklidan foydalanganda generator tizimlarining o'tkinchi jarayonlarini tavsiflashda xarakterli qiyinchiliklar yuzaga keladi, chunki stator zanjirlar o'zgaruvchilar o'zgarishi yuz beradi. Asinxron generotorning yuklamada ishlashi ko'pincha stator zanjirlarining nosimetriyasi bilan tavsiflanadi, shuning uchun a, b, 0 o'qlarida tenglamalar tizimini qo'llash tavsija etiladi, bu esa elektr mashinasi oniy holatini aniqlashga va hisoblash resurslariga talablarini kamaytirish imkonini beradi.

MikroGES qurilmalaridagi kondensator yordamida o'z-o'zidan qo'zg'atishli asinxron generotorning kompyuter yordamidagi dinamik ish rejimlarini xarakteristikalarini olish uchun avvalo matematik modelda keltirib o'tilgan kovishli gidroturbinaning hamda kondensatorli o'z-o'zidan qo'zg'atishli asinxron generetorning differential tenglamalari, matematik tavsifi, matematik modeli va strukturaviy sxemalaridan foydalilanilgan holda MatLab dasturi Simulink paketi matematik imitatsion model ishlab chiqildi (1-rasm).

1-rasm. Avtonom mikroGES asinxron generotorning imitatsion modeli

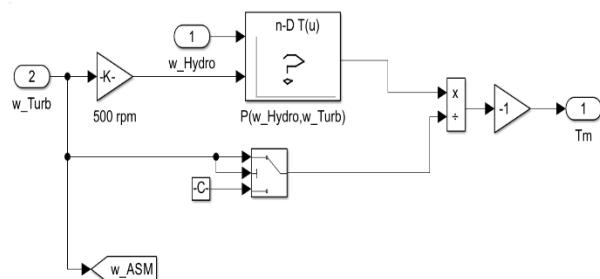

Ushbu imitatsion modelda quyidagi elementlardan foydalilanilgan:

1) Kovishli gidroturbina – ushbu elementda kovishli gidroturbinaning parametrlari – diametri = 300 mm uzunligi = 500 mm, kovish diametri = 100 mm, kovishlar soni = 12 ta, kovish hajmi = 150 sm<sup>3</sup>, kovish shakli – yarim shar.

Kovishli gidroturbina elementi (2-rasm) da  $w_{Turb}$  suv eneriyasi ta'sirida kovishli gidroturbina olayotgan tezlik

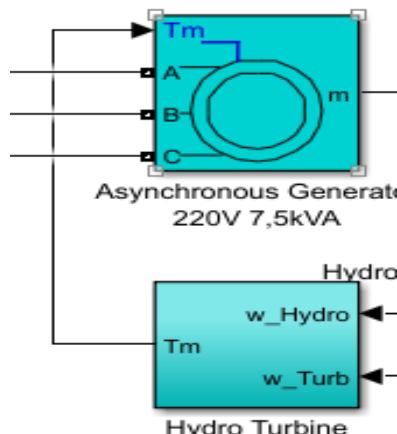

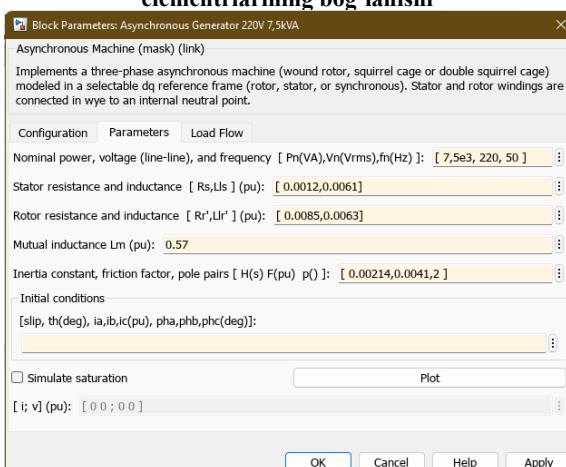

bo'lib, uning ta'sirida ishlab chiqarilayotan mexanik energiya  $P(w_{Hydro}, w_{Turb})$  bloki orqali aniqlanadi, ushu element natijasi sifatida  $T_m$  mexanik moment olinadi.

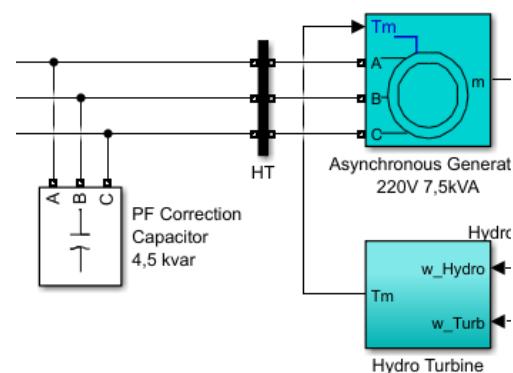

**2-rasm. Kovishli gidroturbina elementi**

2) Asinxron generator yuqorida keltirilgan asinxron generatordan parametrlari –  $R_s$ ,  $L_s$ ,  $R_r$ ,  $L_r$ ,  $L_m$ , *Inersiya*, *Magnit induksiya*, *jift qutblar soni* asosida kovishli gidroturbinadan berilayotgan mexanik energiya yordamida elektr energiya ishlab chiqaradi (3-4-rasmlar).

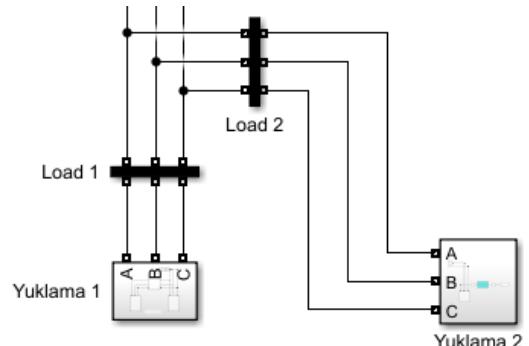

2-rasmda ko'rsatib o'tilgan kondensator asinxron mashinani generator rejimida ishlash imkonini beradi. Uch fazalni kondensator (5-rasm) asinxron mashina ishga tushgan vaqtida dvigatel rejimida tarmoqdan oladigan reaktiv energiyani o'zidan ishlab chiqarib beradi, trubinadan berilayotgan mexanik energiya asinxron mashina rotorining nominal tezligini 10 % orttirib berilganda asinxron mashina generator rejimiga o'tadi, o'lchov elementlarida asinxron generator stator chulg'amlari uchlarida o'zgaruvchan sinusoidal kuchlanish hosil bo'ladi.

**3-rasm. Kovishli gidroturbina va asinxron generator elementlарining bog'lanishi****4-rasm. Asinxron generator parametrlari**

Asinxron generator salt ishga tushgan vaqtida rotor tezligi orqali kuchlanish 220 V da bo'lishi ta'minlanadi.

**5-rasm. Uch fazali kondensatori tarmoqda ulanish modeli**

Yuklama ulagan vaqtida generatordan chiqayotgan kuchlanish tushuvi hisobiga tarmoqda 220 V bo'lmaydi, bunda o'lchov-nazorat qurilmalari yordamida kuchlanish 220 V bo'lashi ta'minlanadi (6-rasm). Bunda variator qurilmasi yordamida turbinadan berilayotgan tezlik o'zgartiriladi, uning hisobiga generatordan chiqarilayotgan kuchlanish rostlanadi.

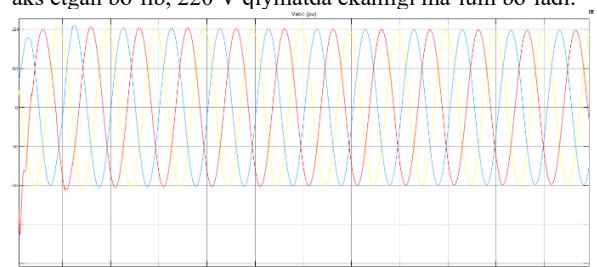

**6-rasm. Tarmoqqa yuklamalarning ulanishi**

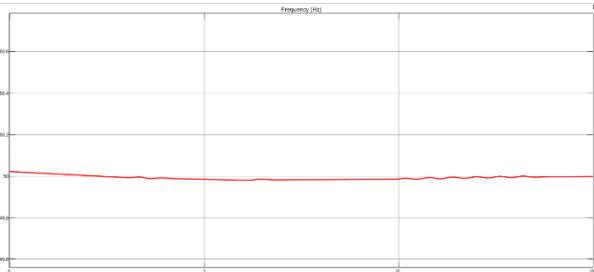

Yuklama ulangandan so'ng chiqish kuchlanishi yuklama holatiga qarab o'zgarishi kuzatiladi ushuu holatni ishlab chiqilgan imitatsion model orqali nazorat qilish mumkin bo'ladi.

### 3. Natija va muhokamalar

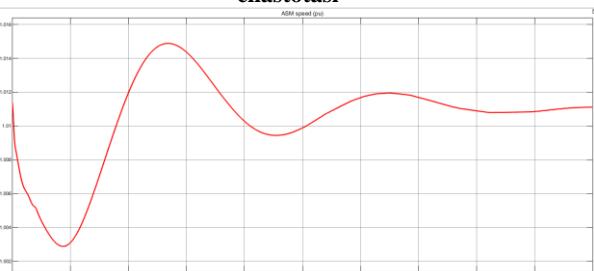

Tarmoqqa yuklamalarning ulanishi davomida asinxron generatordagi o'tkinchi jarayonlarni tahlil qilish *Scope* elementi orqali olingan xarakteristikasi tahlil qilinadi.

Salt ishlash rejimadagi kuchlanishlar oniy qiymatlari 7-rasmda ko'rsatilgan. Grafikda asinxron generator tomonidan ishlab chiqarilayotgan o'zgaruvchan uch fazalni kuchlanish aks etgan bo'lib, 220 V qiymatda ekanligi ma'lum bo'ladi.

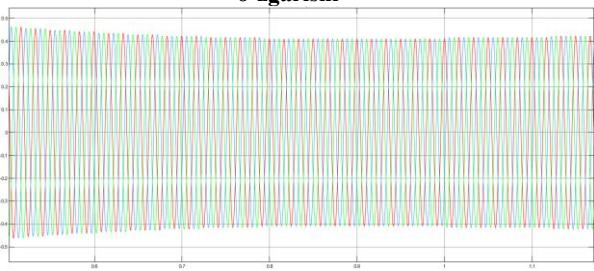

**7-rasm. Asinxron generator salt ishlash vaqtidagi stator uchta fazasidagi kuchlanishlar**

**8-rasm. Asinxron generatorda ishga tushish hamda salt ishlash vaqtidagi tarmoqqa berilayotgan kuchlanish chasotasi**

**9-rasm. Asinxron generator rotorining ishga tushish, salt ishlash hamda yuklama vaqtidagi rotor tezligini o'zgarishi**

**10-rasm. Yuklama vaqtidagi stator fazalaridagi toklarning oniy qiymatlari**

Yuqoridagi imitatsion model yordamida olingan harakteristikalar yordamida mikroGESlarda qo'llaniluvchi asinxron generatori chiqish kuchlanish, tok o'zgarishlarini tahlil qilish hamda nazorat qilish imkoniyati yaratildi.

## 4. Xulosa

Avtonom mikroGESlarda qo'llaniluvchi kondensator orqali qo'zg'atiluvchi asinxron generator va uning boshqaruv qurilmasining tajriba-sinov namunasi hamda imitatsion modeli ishlab chiqildi. Ishlab chiqilgan imitatsion model yordamida mikroGESlarda qo'llaniluvchi asinxron generatorning dinamik ish rejimlarini tahlil qilish imkoniyati yaratildi hamda tahlil qilish orqali natijaviy xarakteristikalar ham olishga erishildi va asinxron generatorining chiqish kuchlanishlarini boshqarish nazorat qilish imkoniyati yaratildi.
